

River Stage Data

This page is basically an illustration of the previous page, documenting the damage and/or problems at various stages. It illustrates the critical impacts at certain stage heights and the date of their occurrence. The flood stage is usually plotted at the bottom, with various significant events plotted in ascending order above the flood stage. Enter enough critical stage heights and accompanying damage descriptions as necessary, to paint an accurate picture of possible impacts that can occur above the official flood stage.

Reach: This should be a description of the physical aspects of the reach of the river for which the stage and forecasts are representative.
